

VLA Functional Block Diagram

Circuit Image Processing System Schematic

Descriptions:

1. IN_S: Input Simulated Circuit Image
2. IN_P: Input Physically Assembled Circuit Image
3. DB_TS: Database-Temporary Storage of Simulated Circuit Image
4. DB_TP: Database-Temporary Storage of Physical Circuit Image
5. DB_NS: Database-Prestored Netlist Data for Simulation
6. DB_NP: Database-Prestored Netlist Data for Hardware Circuit
7. DB_NR: Database-Netlist Result from Analysis
8. T_IS: Tool for Image Detection and Processing in Simulation mode

Functional Block Diagram

Sample Output

Remember each node corresponds to one numbered row on your breadboard.
Positive lead of source xV1 should be connected to node 1
One lead of resistor rR1 should be connected to node 1
One lead of inductor lL1 should be connected to node 2
One lead of resistor rR1 should be connected to node 2
One lead of inductor lL1 should be connected to node 3
One lead of capacitor cC1 should be connected to node 3
Negative lead of source xV1 should be connected to node 4
One lead of capacitor cC1 should be connected to node 4

Sample Output

Remember each node corresponds to one numbered row on your breadboard.
Negative lead of voltage source v_1 should be connected to node 0
One lead of resistor r_1 should be connected to node 0
Positive lead of voltage source v_1 should be connected to node 1
One lead of capacitor c_1 should be connected to node 1
One lead of capacitor c_2 should be connected to node 1
One lead of capacitor c_1 should be connected to node 2
One lead of resistor r_1 should be connected to node 2
One lead of capacitor c_2 should be connected to node 2

Sample Output

Remember each node corresponds to one numbered row on your breadboard.
Negative lead of voltage source v_1 should be connected to node 0
Negative lead of voltage source v_2 should be connected to node 0
One lead of resistor r_3 should be connected to node 0
Positive lead of voltage source v_1 should be connected to node 1
One lead of resistor r_1 should be connected to node 1
One lead of resistor r_1 should be connected to node 2
One lead of resistor r_2 should be connected to node 2
One lead of resistor r_3 should be connected to node 2
Positive lead of voltage source v_2 should be connected to node 3
One lead of resistor r_2 should be connected to node 3
